1. Create a repository in GitHub.

The first thing we should do is to sign in our GitHub account (if you don't have sign on). After that we go in our profile and click “my repositories”.

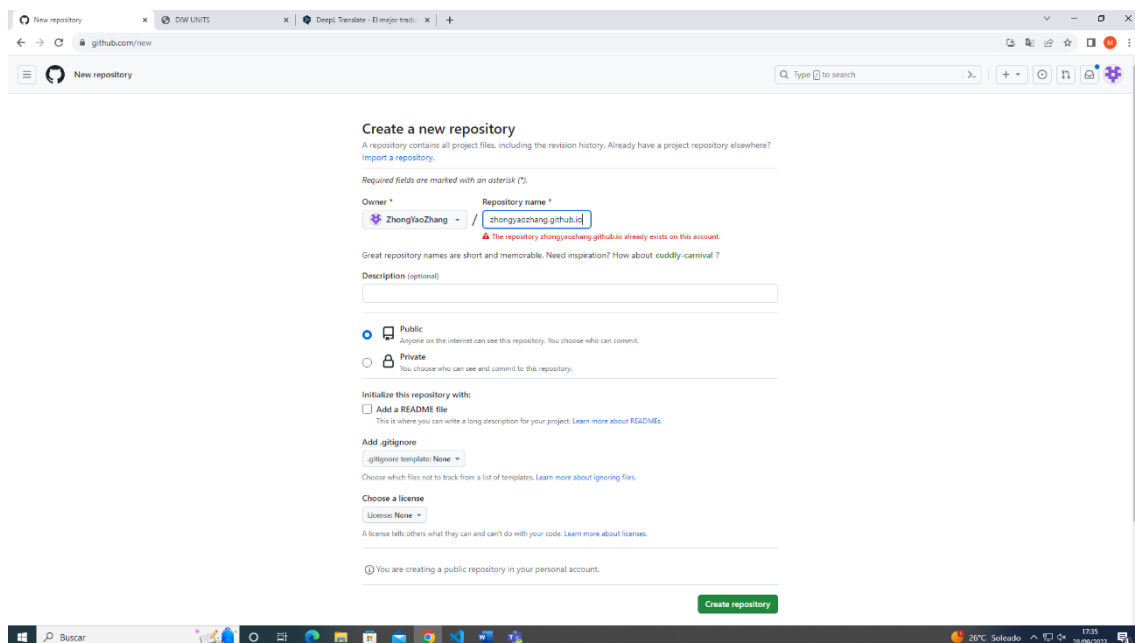

Once you are in at the right top side there is a green button which says “new”, we click on there and we will be redirected to a new window where we can set the configuration of our repository.

First thing we should set is the repository name and it should our full name and then follow by .github.io, that in my case is zhongyaozhang.github.io.

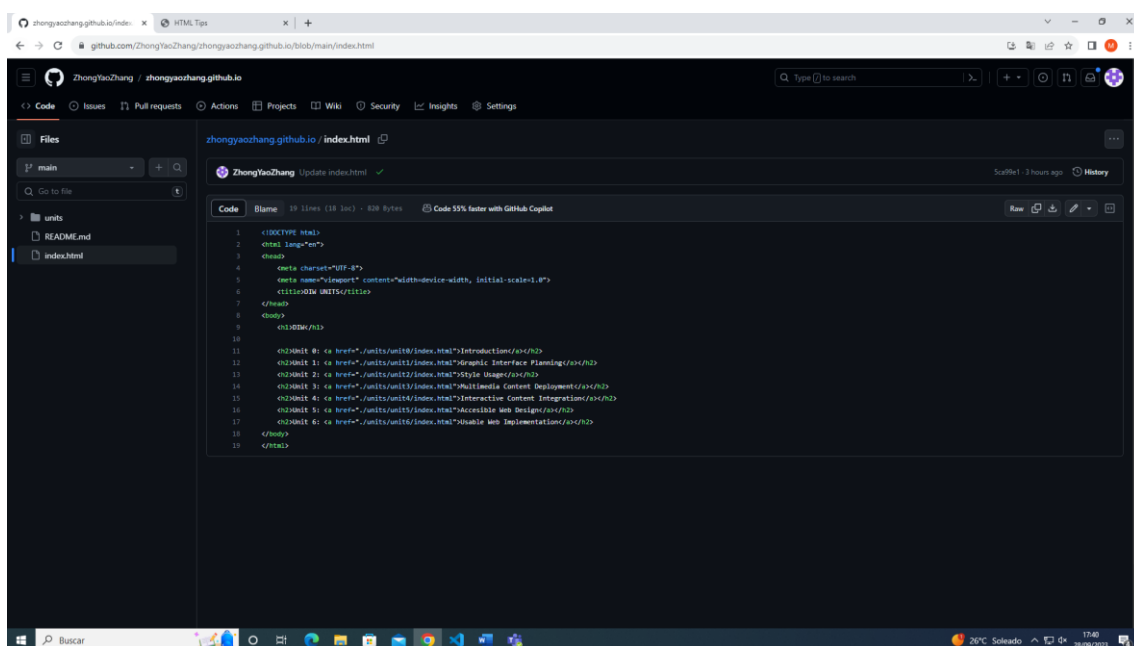

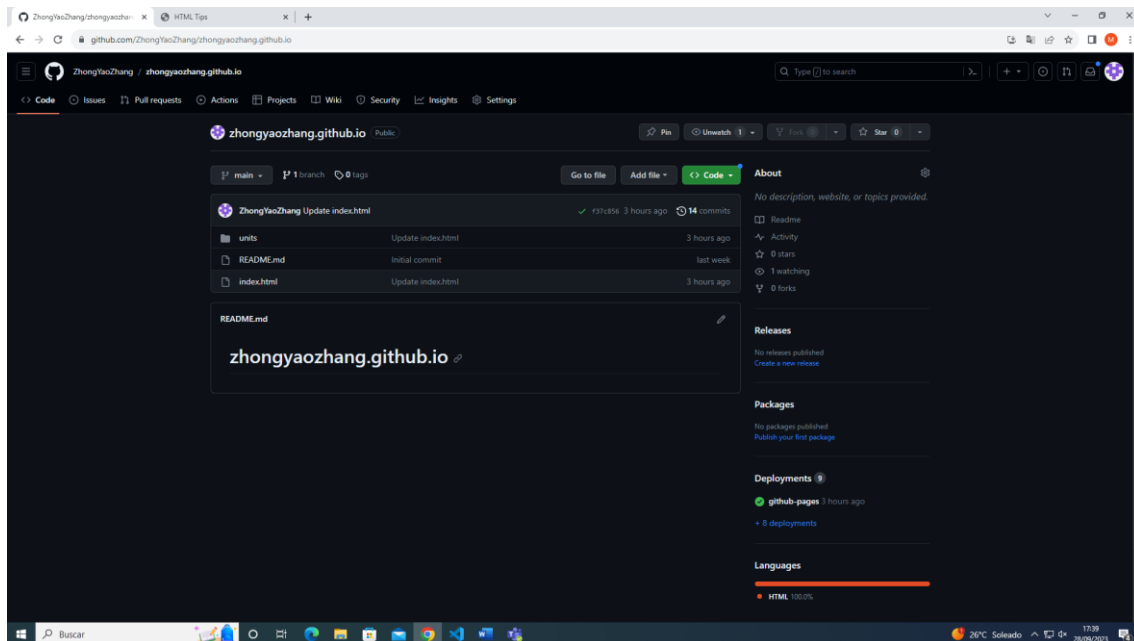

Then we set our repository public and click on create repository from bottom.

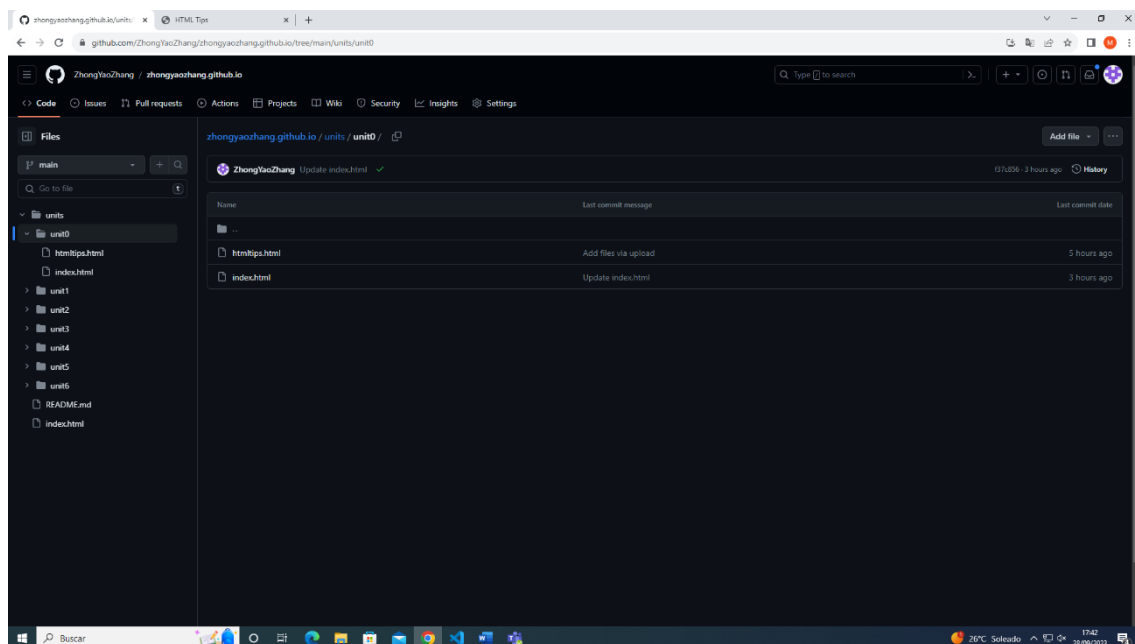

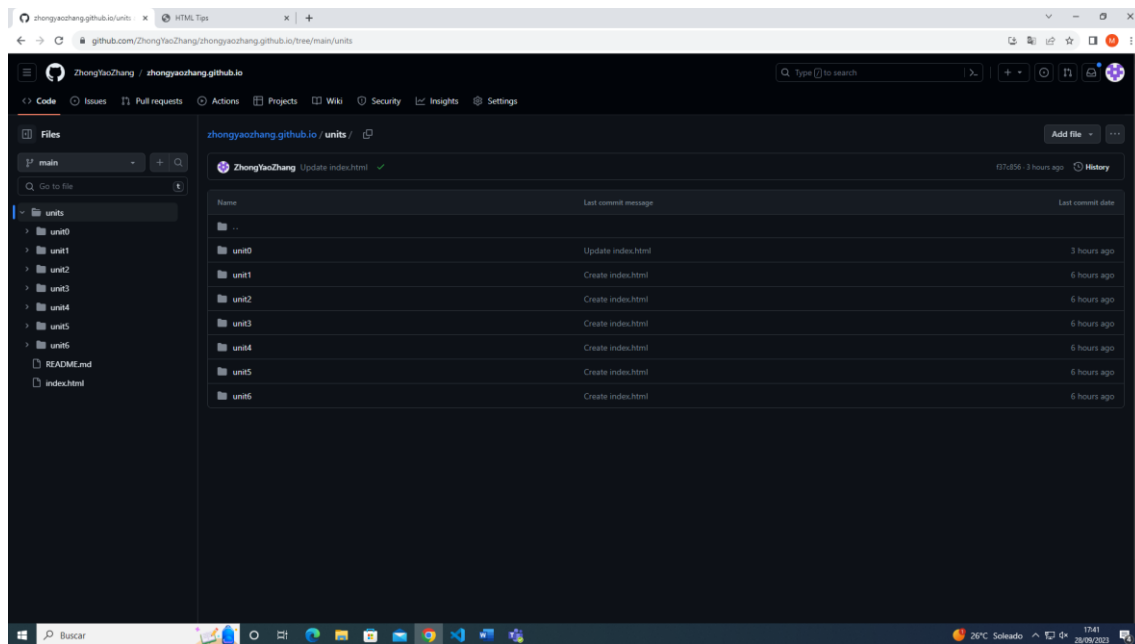

(I already created a repository with that name that's why it tells me the error)

2. Do the htmls and upload then to our page.

Now we continue by creating the necessary htmls to our page. We need a index for the main page and then for each units we need a index too. We can connect our GitHub page with Visual Studio Code but i didn't figure out how to do it so i had to write the htmls in the Visual Studio and then upload to the GitHub page. Our index.html must not have an error or our page will not work.

If we have done all the previous steps correctly then our page should be finished, all we have to do is to go to visit the website by introducing `zhongyaozhang.github.io` and check it out.

3. Bibliography.
